

Updates and Outcomes in the New Kidney Transplant Allocation System

The Renal and Pancreas Transplant Division at Saint Barnabas Medical Center

September 21, 2021

Updates & Outcomes in the New Kidney Allocation System

September 21, 2021

Francis L. Weng, MD, MSCE

Chief

Renal & Pancreas Transplant Division

Saint Barnabas Medical Center

Livingston, NJ

Outline

- The prior, old kidney allocation system
 - The new kidney allocation system
- Impact of the new system

The old kidney allocation system (prior to Mar 15, 2021)

The "old" system for allocating deceased donor kidneys had been in place since Dec 2014

Pre-Dec 2014: "Old old" system

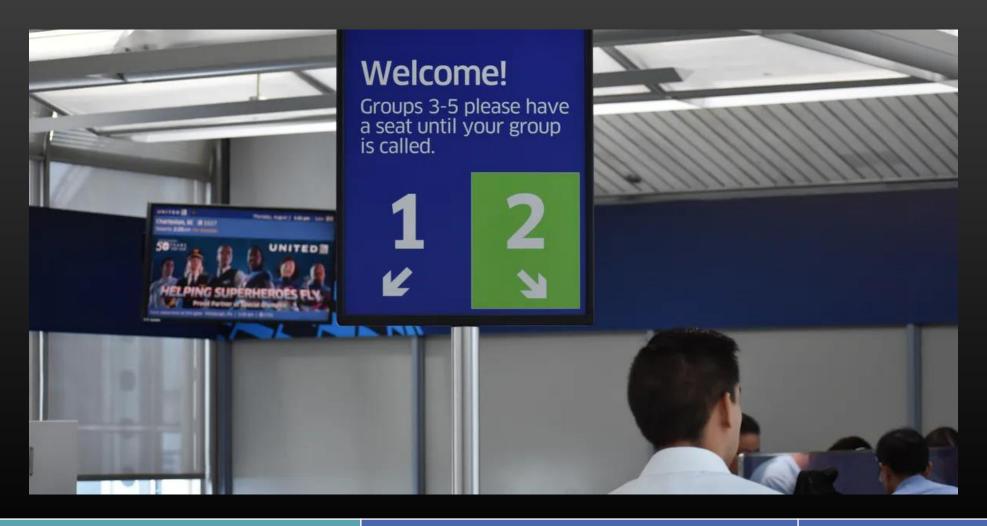

Dec 2014-Mar 2021: "Old" system

Mar 2021present: "New" system

Allocating kidneys is mainly based upon 2 factors: classifications/categories and points/waiting time

1st classification/category Sorted by points 2nd classification/category Sorted by points 3rd classification/category Sorted by point

This 2-step system of sorting is similar to other systems, such as boarding passengers onto a plane

In the old and new system, kidneys are allocated within certain categories or "classifications"

1

•0-mismatch, cPRA =100%

2

•cPRA =100%

3

•0-mismatch, cPRA =99%

4

•cPRA =99%

There are dozens of these classifications

Table 8-8: Allocation of Kidneys from Deceased Donors with KDPI Scores Greater Than 85%				
Classification	Candidates that are within the:	And are:	And the donor is this blood type:	
1	OPO's DSA	0-ABDR mismatch, CPRA equal to 100%, blood type permissible or identical	Any	
2	OPO's DSA	CPRA equal to 100%, blood type permissible or identical	Any	
3	OPO's region	0-ABDR mismatch, CPRA equal to 100%, blood type permissible or identical	Any	
4	OPO's region	CPRA equal to 100%, blood type permissible or identical	Any	
5	Nation	0-ABDR mismatch, CPRA equal to 100%, blood type permissible or identical	Any	
6	Nation	CPRA equal to 100%, blood type permissible or identical	Any	
7	OPO's DSA	0-ABDR mismatch, CPRA equal to 99%, blood type permissible or identical	Any	
8	OPO's DSA	CPRA equal to 99%, blood type permissible or identical	Any	
9	OPO's region	0-ABDR mismatch, CPRA equal to 99%, blood type permissible or identical	Any	
10	OPO's region	CPRA equal to 99%, blood type permissible or identical	Any	
11	OPO's DSA	0-ABDR mismatch, CPRA equal to 98%, blood type permissible or identical	Any	
12	OPO's DSA	CPRA equal to 98%, blood type permissible or identical	Any	
13	OPO's DSA	0-ABDR mismatch, blood type permissible or identical	Any	
14	OPO's region	0-ABDR mismatch, CPRA greater than or equal to 80%, and blood type identical	Any	

In the old system, points for adult candidates on the waiting list are based on 4 factors

Waiting time Panel reactive antibody (PRA) Prior living donor (4 points) Level of matching (0, 1, or 2 points) "Waiting time" is calculated as 1/365 points for each day, starting with the earliest of 2 dates

Date of initiation of chronic dialysis

OR

Date that eGFR or CrCl became ≤20 ml/min, if listed before starting dialysis

If their PRA is extremely high, then candidates can get a very large number of points

If the cPRA is:	Then the candidate receives this many points:	If the cPRA is:	Then the candidate receives this many points:
0-19	0.00	85-89	4.05
20-29	0.08	90-94	6.71
30-39	0.21	95	10.82
40-49	0.34	96	12.17
50-59	0.48	97	17.30
60-69	0.81	98	24.40
70-74	1.09	99	50.09
75-79	1.58	100	202.10
80-84	2.46		

Here are 2 examples of how points are calculated for candidates on the kidney waiting list

Patient A

- On hemodialysis for 2 years before he starts transplant evaluation
 - Listed after being on dialysis 3.2 years
- PRA = 0% (0 points)
- He would have 3.2 points
 - Could have 4.2 or 5.2 points, depending on the particular donor

Patient B

- Placed on waiting list 0.8 years before starting peritoneal dialysis
- Been on PD for 1.3 years
- PRA = 99% (50.09 points)
- She would have 52.19 points
 - Could have <u>53.19 or 54.19 points</u>, depending on the particular donor

Within each classification, kidneys were first allocated locally, within a donation service area (DSA)

1

• 0-mismatch, cPRA =100%

Within local donation service area

• 0-mismatch, cPRA =100%

• Within Region

2

• 0-mismatch, cPRA=100%

Nationally

• cPRA =100%

• Within local donation service area

Each donation service area (DSA) is served by an

organ procurement organization (OPO),

so the 2 terms are often used interchangeably

Our DSA or OPO serves north NJ and part of south NJ:

NJ Sharing Network

Within each classification, patients are "sorted", mainly based upon points

1

• 0-mismatch, cPRA =100%

Within local donation service area

2

• 0-mismatch, cPRA =100%

• Within Region

3

• 0-mismatch, cPRA=100%

Nationally

• cPRA =100%

Within local donation service area

215.10 pts: Smith, John

After local allocation, kidneys were allocated regionally and then nationally

1

• 0-mismatch, cPRA =100%

Within local donation service area

2

• 0-mismatch, cPRA =100%

Within Region

3

• 0-mismatch, cPRA=100%

Nationally

• cPRA =100%

4

• Within local donation service area

215.10 pts: Smith, John

222.45 pts: Black, Anne

212.94 pts: Miller, Ken

216.77 pts: Baker, Emily

216.65 pts: Miller, Jude

210.38 pts: Davis, Jon

The old system favored use of the kidneys locally, in the same DSA where they were procured

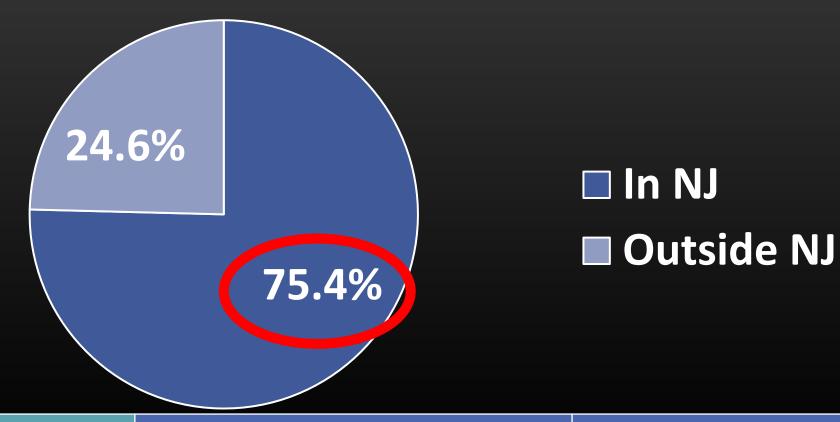

Allocate locally

Allocate nationally

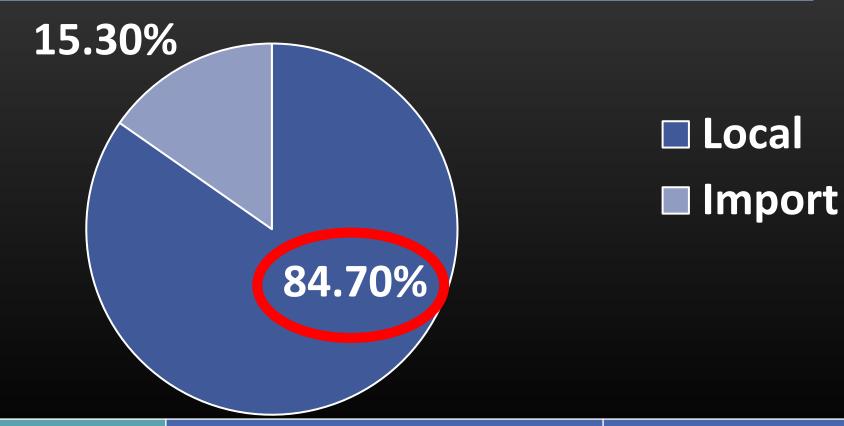

Most of the kidneys procured in New Jersey were transplanted at NJ transplant centers

Location of transplants of kidneys procured by NJ Sharing Network

Most of Saint Barnabas' deceased donor kidneys came from NJ Sharing Network, the local OPO

Source of Deceased Donor Kidneys at SBMC

When a kidney donor was available in NJ, the logistics of transplant were well-established

Rank	Center	Patient	PRA	Points
1	National Center X	AAA	100%	212.1
2	Regional Center Y	BBB	20%	6.31
3	Saint Barnabas	CCC	0%	6.29
4	Saint Barnabas	DDD	0%	6.28
5	Local Center A	EEE	25%	6.17
6	Saint Barnabas	FFF	32%	6.11
7	Local Center A	GGG	0%	6.01
8	Saint Barnabas	ННН	0%	6.00
9	Saint Barnabas	Ш	0%	5.97
10	Local Center B	JJJ	12%	5.93
11	Saint Barnabas	LLL	0%	5.80
12	Saint Barnabas	MMM	0%	5.77
13	Saint Barnabas	NNN	0%	5.75

- Most of the patients on the match run list for the patient were patients listed at Saint Barnabas
- Many patients on the list actually can't receive a transplant at that time from that donor
 - Positive crossmatch
 - Patient is ill or not truly ready
 - Transplant center declines that donor

When a kidney donor was available in NJ, the logistics of transplant were well-established

Rank	Center	Patient	PRA	Points
	Ç			
3	Saint Barnabas	CCC	0%	6.29
4	Saint Barnabas	DDD	0%	6.28
7	Local Center A	GGG	0%	6.01
8	Saint Barnabas	ННН	0%	6.00
9	Saint Barnabas	Ш	0%	5.97
10	Local Center B	JJJ	12%	5.93
11	Saint Barnabas	LLL	0%	5.80
12	Saint Barnabas	MMM	0%	5.77
13	Saint Barnabas	NNN	0%	5.75

- 100% PRA patient nationally is actually medically not ready
- Regional Center Y declines the kidney
- One of the patients from Local Center A has positive crossmatch
- One of the Saint Barnabas patients not truly available

The old system had some predictability for transplant centers and OPO's

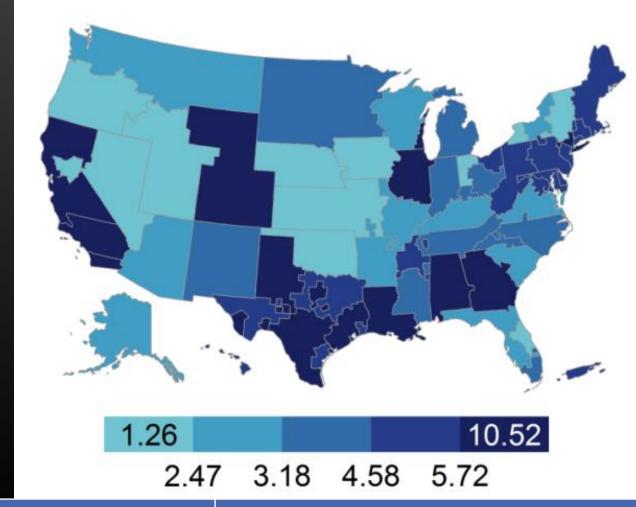

Rank	Center	Patient	PRA	Points
	,			
3	Saint Barnabas	CCC	0%	6.29
4	Saint Barnabas	DDD	0%	6.28
7	Local Center A	GGG	0%	6.01
8	Saint Barnabas	ННН	0%	6.00
9	Saint Barnabas	Ш	0%	5.97
10	Local Center B	JJJ	12%	5.93
11	Saint Barnabas	LLL	0%	5.80
12	Saint Barnabas	MMM	0%	5.77
13	Saint Barnabas	NNN	0%	5.75

Both Saint Barnabas and NJ Sharing Network had a good idea, early in the donation process, regarding which patient might get a transplant from that donor

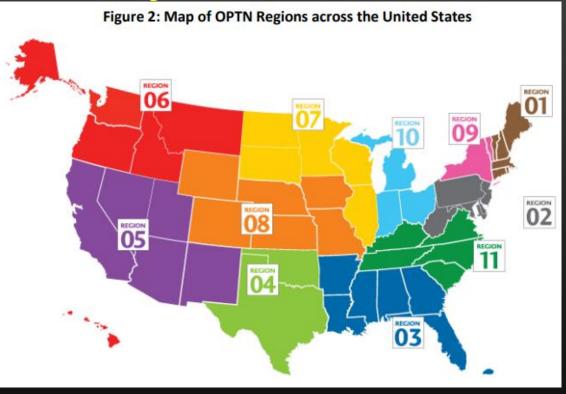

The old system, however, led to large geographic differences and disparities in waiting times for DDKT

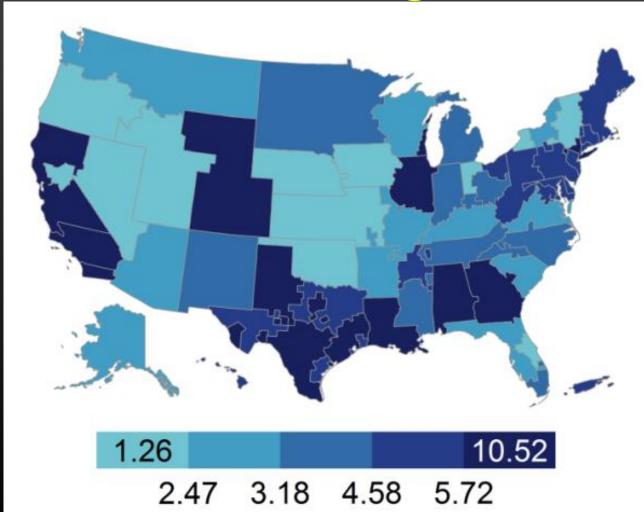

Median waiting times
 varied from <u>1.28 - 10.52</u>
 years

 These differences are not due to regional differences in age, race, sex, blood type, or PRA

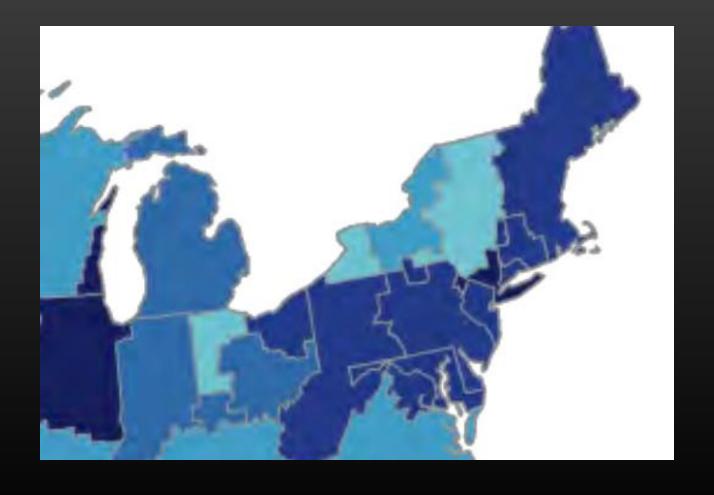

Waiting times could differ greatly between adjacent donation service areas and regions

These large differences led to patients listing at multiple centers, to decrease waiting time

Patients who originally listed at transplant centers in New York City would often try to list elsewhere

These large geographic differences violated federal rules, so the system had to change

- Federal "Final Rule" governs organ transplant in U.S. and states that
 - Allocation policies "shall not be based on a candidate's place of residence or place of listing", except to extent required by other regulations
- BUT, place of listing (DSA) is the #1 largest factor affecting kidney allocation
 - Place of listing is more important than PRA, blood type, diagnosis, age, education level, insurance type, race/ethnicity, gender, or any other factor, in determining likelihood of receiving a DDKT

Changes to the old system were debated throughout 2019 and approved in Dec 2019

Organ Procurement and Transplantation Network

Eliminate the use of DSA and Region in kidney allocation policy

Home » Governance » Public Comment » Eliminate the use of DSA and Region in kidney allocation policy

Proposal Overview

Status: Implemented

Sponsoring Committee: Kidney Transplantation

Strategic Goal: Provide equity in access to transplants

Policy Notice 12/2019 (PDF - 1,449 K)

Summary of the old kidney allocation system, prior to March 15, 2021

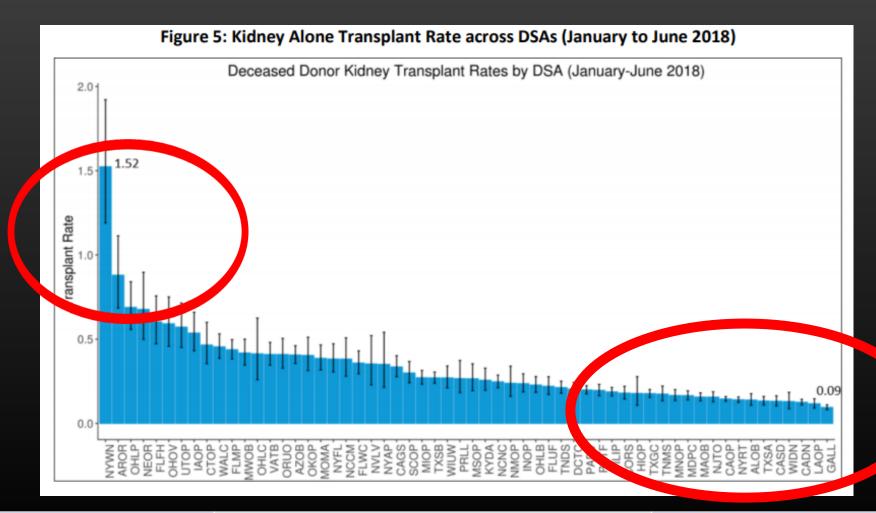

Favored local use of kidneys

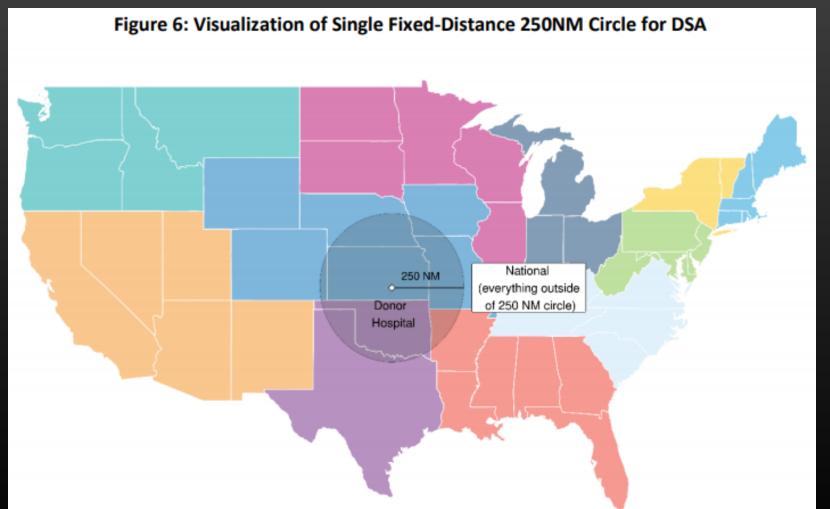

Caused large geographic inequities in transplant rate

The new kidney transplant allocation system (starting Mar 15)

The new system is designed to decrease the 15fold geographic variation in transplant rates

In the new system, kidneys are first allocated in a 250NM circle around the donor hospital

Now, instead of 3
geographic
categories, there are
only 2 geographic
categories

- 1) Within 250NM
- 2) National

Based upon the distance from donor hospital to transplant center, patient may get extra points

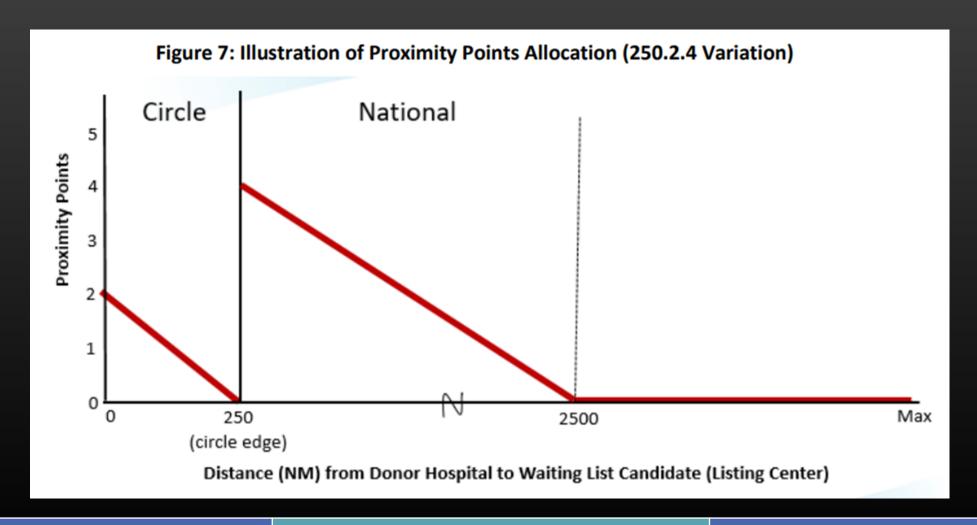

Within the 250NM circle

- Candidates get up to 2 proximity points
- 2 proximity points if donor hospital is 0 NM from the transplant center
- Zero proximity points if candidate's transplant center is 250 NM distance from the donor hospital

Nationally

- Candidates get up to 4 proximity points, going out to 2500NM
- 4 proximity points if donor hospital is 250 NM from the transplant center
- Zero proximity points if candidate's transplant center is 2500 NM distance from the donor hospital

Based upon the distance from donor hospital to transplant center, patient may get extra points

In the new system, adult candidates on the waiting list get points based on 5 factors

Waiting time Panel reactive antibody (PRA) Prior living donor (4 points) Level of matching (0, 1, or 2 points) Proximity points (up to 2 points if within 250NM and 4 points if national)

Kidneys are still allocated by classification, but local DSA and regions are not used to allocate

• 0-mismatch, cPRA =100%

Within 250NM

• cPRA =100%

Within 250NM

• 0-mismatch, cPRA=100%

Nationally

• cPRA =100%

Nationally

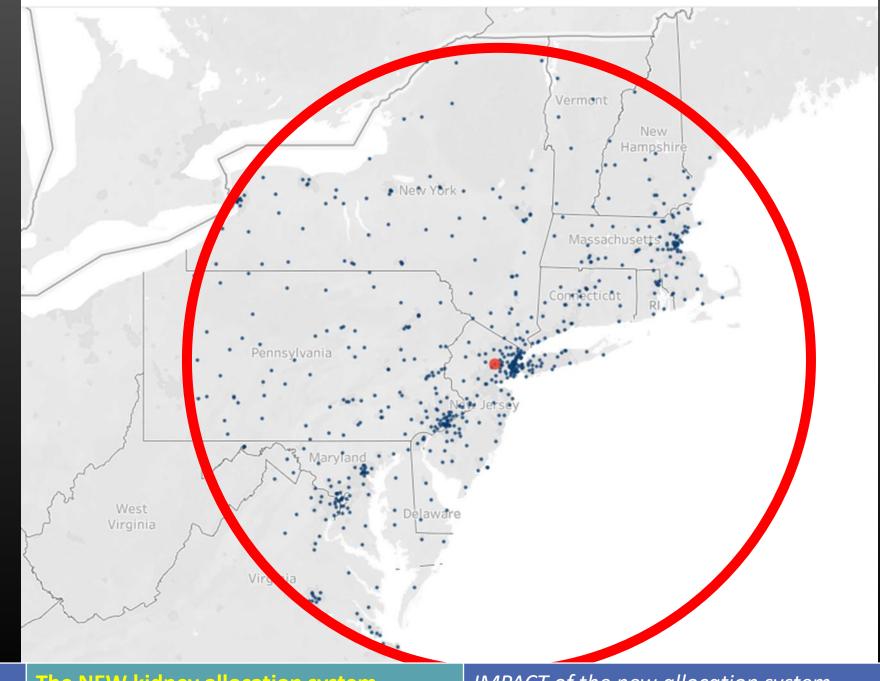

Within each classification, the only 2 geographic categories are now 250NM vs national

4

How large is a 250NM radius?

This circle is drawn around Saint Barnabas,

and stretches from Maine to Virginia

How are points NOW calculated for candidates on the kidney waiting list?

Patient A

- On hemodialysis for 2 years before he starts transplant evaluation
 - Listed after being on dialysis 3.2 years
- PRA = 0% (0 points)
- Distance from transplant center to donor hospital is 100 NM = 1.2 proximity points
- He would have 3.2 points + 1.2 proximity points, or 4.4 points
 - Could have <u>5.4 or 6.4 points</u>, depending on the particular donor

Patient B

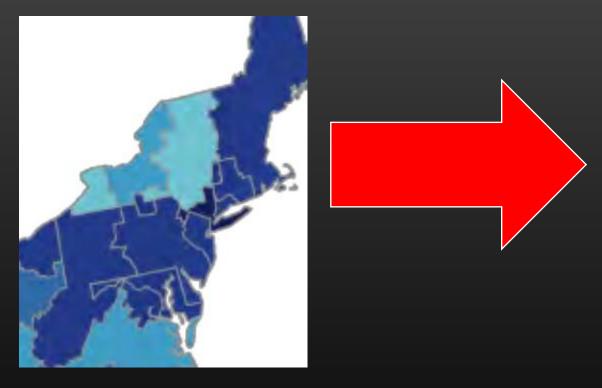

- Placed on waiting list 0.8 years before starting peritoneal dialysis
- Been on PD for 1.3 years
- PRA = 99% (50.09 points)
- Distance from transplant center to donor hospital is <u>7 NM = 1.9</u> <u>proximity points</u>
- She would have <u>52.19 points + 1.9 proximity points</u>, or <u>54.09 points</u>
 - Could have <u>55.09 or 56.09 points</u>, depending on the particular donor

Here's an example of how kidneys are still allocated by classification, within 250NM vs nationally

 Blood type B 27 Within 250NM All remaining candidates Within 250NM 28 Blood type B 29 Within Nation • All remaining candidates Within Nation 30

```
7.10 pts: Smith, John
1.09 pts: Doe, Jane
6.27 pts: Black, Anne
6.25 pts: Miller, Ken
9.41 pts: Baker, Emily
9.39 pts: Miller, Jude
9.38 pts: Davis, Jon
```

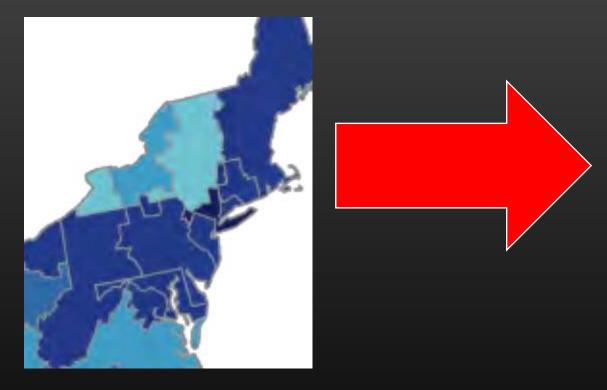

Going from the DSA/region system to 250 NM circles will eliminate the sharp boundaries

 Changes should therefore decrease the large differences in waiting times between DSA's and regions

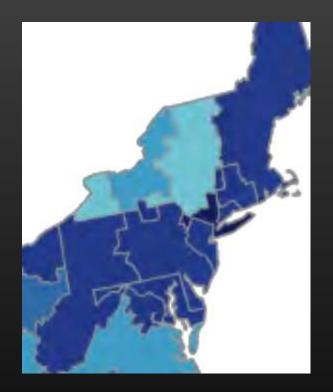

Going from the DSA/region system to 250 NM circles will lead to more shipped kidneys

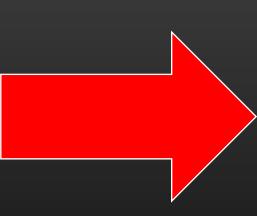

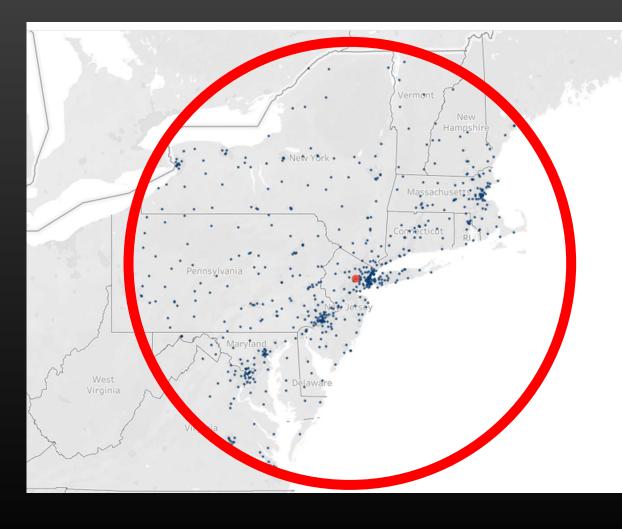

• 250 NM radius is large, and most centers in the circle are in a different OPO

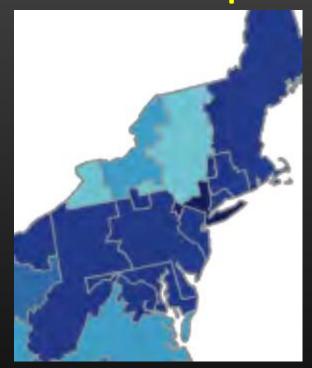

Use of proximity points is a way to slightly favor "local" allocation of kidneys

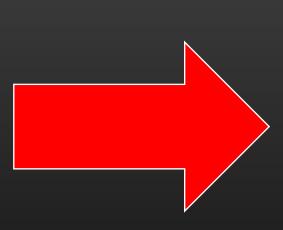

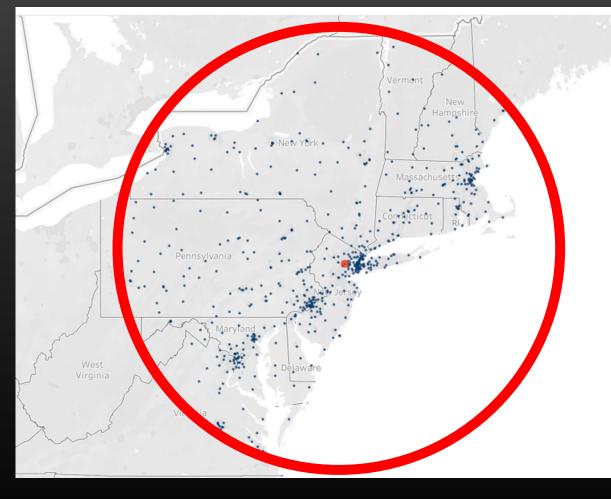

For any classification, candidates inside the 250NM circle are prioritized over those outside the circle

Summary of the new kidney allocation system, starting March 15, 2021

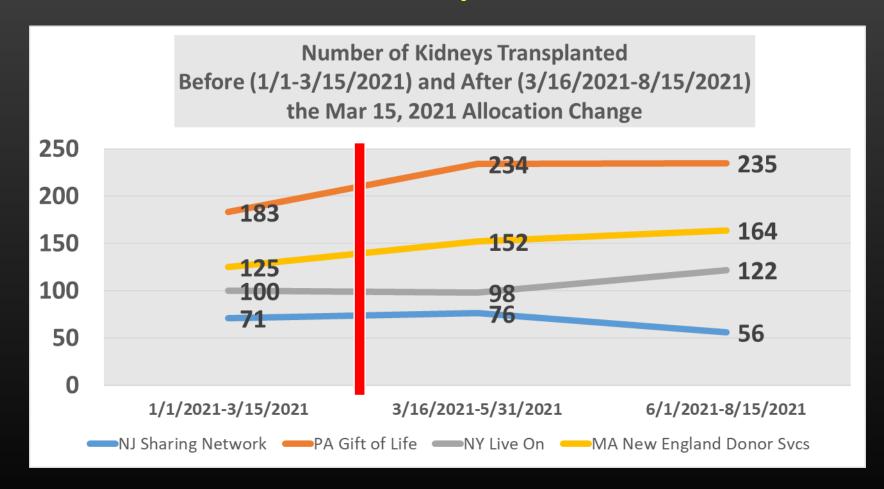

Favors sharing of kidneys in a 250 NM circle

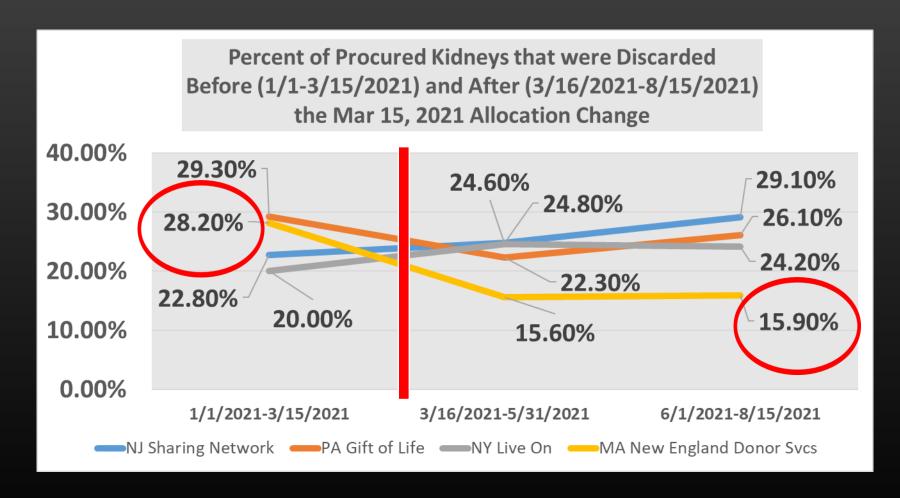

Impact of the new kidney transplant allocation system

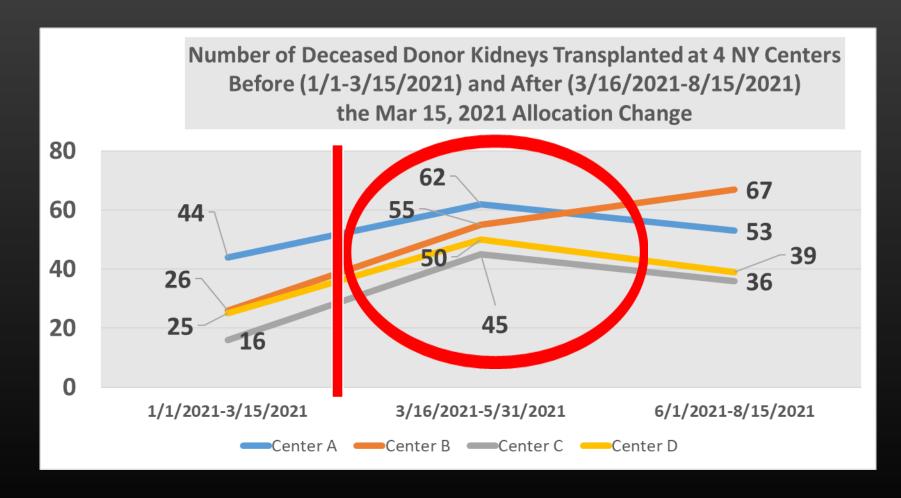

Since Mar 15, kidney transplants from nearby DSA/OPO's have actually increased

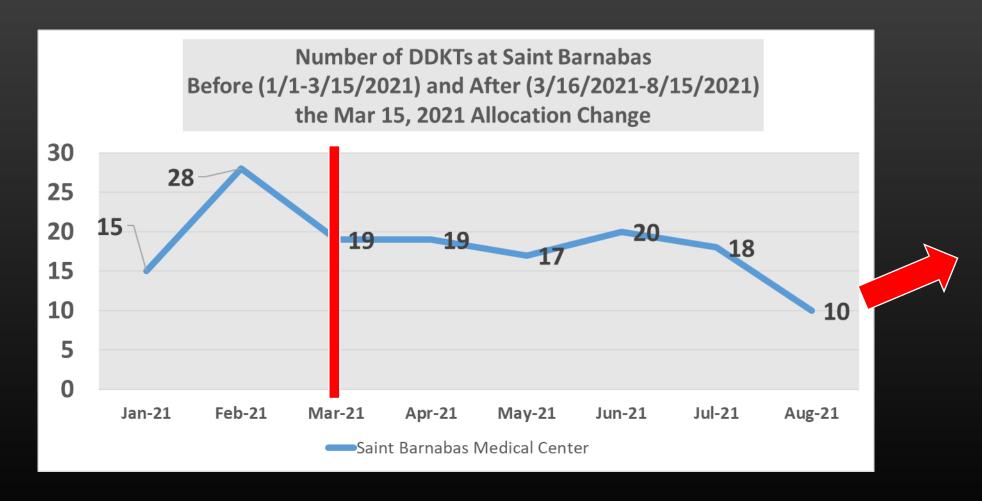

Fewer kidneys are being discarded, probably because of broader sharing in these 250NM circles

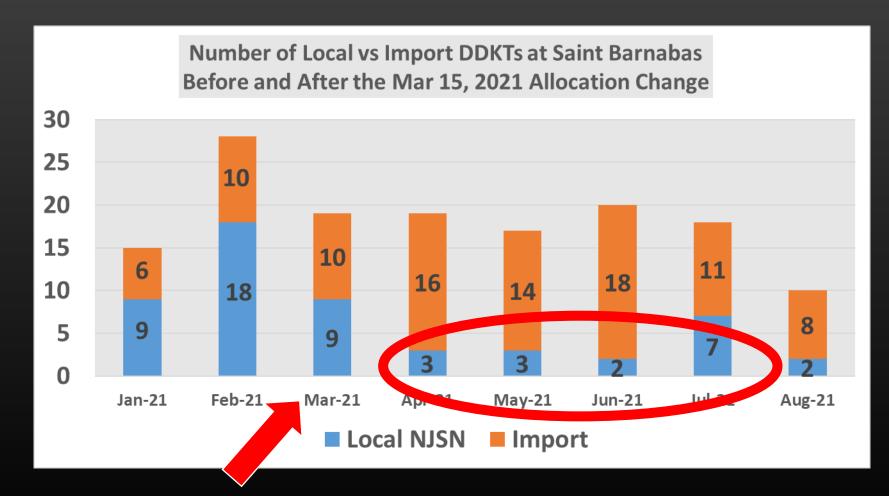

At some centers in DSA's with long waiting times, the number of transplants has greatly increased

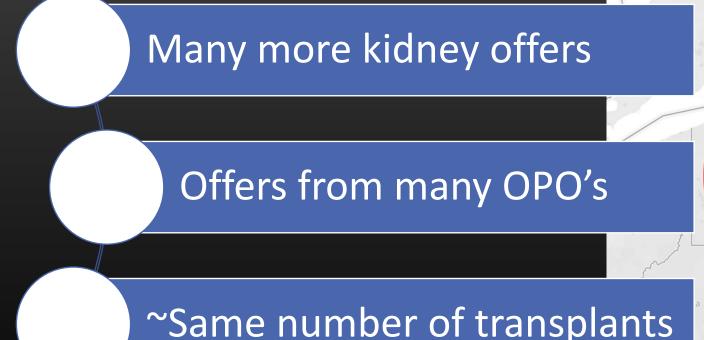

At Saint Barnabas, the number of deceased donor kidney transplants has been mostly steady

At Saint Barnabas, most of our deceased donor kidneys are now import kidneys

Sharing kidneys within 250 NM circles has created many consequences

Sharing kidneys within 250 NM circles has created many consequences

More shipped kidneys

Longer cold ischemic times

More delayed graft function

Patients may get a kidney transplant, even if they're #100 on the list for that kidney donor

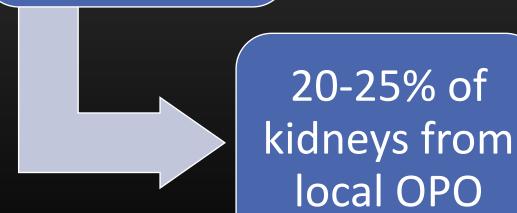

Rank	Center	Patient	PRA	Points
1	National Center X	AAA	100%	212.1
2	Regional Center Y	BBB	20%	10.31
3	Regional Center Y	CCC	0%	10.29
4	Regional Center Y	DDD	0%	10.28
5	Regional Center Y	EEE	25%	10.17
6	Regional Center Y	FFF	32%	10.11
7-90	Other centers			
91	Saint Barnabas	ннн	0%	6.00
92	Saint Barnabas	Ш	0%	5.97
93	Local Center B	JJJ	12%	5.93
94	Regional Center	LLL	0%	5.80
95	Regional Center	MMM	0%	5.77
96	Regional Center	NNN	0%	5.75

- There are dozens of kidney transplant centers in the Northeast
- Centers may decline a kidney for their patient for many reasons

Transplant centers and OPO's have had to develop many new relationships with each other

85% of kidneys from local OPO

In 2020 at Saint Barnabas

So far, after
 Mar 15,
 2021, at Saint
 Barnabas

What should our transplant candidates know about these changes?

Even if the kidney offer is turned down by other transplant centers and patients, it should be a good kidney for you

The kidney transplant might be "sleepy" in the beginning, so you might need dialysis in the first few days and weeks

Conclusions

The old kidney allocation system favored usage of kidneys **locally**, with limited sharing

 Disadvantage of creating geographic disparities in transplant rate

The new system favors **sharing** of kidneys in large 250 NM circles

Disadvantage of increased shipping and logistical problems

After Mar 15, 2021, the number of deceased donor kidney transplants at Saint Barnabas has remained steady

As the system settles down, we will see and hope that our patients can continue to receive transplant offers and transplants

Thank you for your attention.
